Experiment – 10 : Performance Optimization in Zoho Creator

Aim

To optimize the performance of the Event Desk event management platform developed using Zoho Creator by improving registration monitoring, managing pending-payment reminders, optimizing participant reports, reviewing dashboard components, and maintaining efficient API integration.

Theory

Event Desk is an event management platform designed to manage participant registrations, payment statuses, email notifications, registration targets, and event analytics. The platform uses forms, reports, workflows, dashboards, and API connections to simplify registration management and improve administrative efficiency.

Performance optimization involves reducing unnecessary operations, improving data presentation, and making workflows more efficient without affecting the existing functionality of the application.

The following features are considered for optimization:

1. Registration Target Monitoring

The Target_Monitoring workflow monitors the total number of registrations in Event_Registration_Form. A registration target of 100 participants is configured. The workflow checks whether the total registration count equals the target before generating a registration target notification.

2. Pending Payment Reminder Management

The Payment_Pending workflow manages reminders for participants whose registration status is Pending Payment. The Reminder_Email_Sent Date-Time field is used to track reminder processing and help avoid repeated reminder attempts for the same registration.

3. Participant Report Optimization

The Event_Registration_Report displays participant registration information. Hiding unnecessary displayed columns improves readability and reduces visual clutter while retaining the underlying fields and records.

4. Dashboard Component Optimization

The platform includes the Registration Status Board, Participation Dashboard, and AI Registration Analytics Dashboard. These dashboards present registration information, participation statistics, key performance indicators, charts, and AI-based insights. Reviewing dashboard components helps identify redundant visualizations and opportunities to improve information presentation.

5. API Integration

The existing event_registration_api_connection, test_participant_api, and test_create_participant support API-related operations. Maintaining the existing integration avoids unnecessary changes to functioning API configurations.

6. Performance Evaluation

Performance can be evaluated using report loading time, dashboard loading time, workflow execution behavior, and notification processing. Repeated measurements provide a basis for comparing application responsiveness. Historical baseline measurements are required to calculate reliable before-and-after performance improvements.

Procedure

1. Open the Event Desk application in Zoho Creator and identify its registration forms, workflows, reports, and dashboards.
2. Examine the Target_Monitoring workflow and its registration-count calculation.
3. Configure the registration target as 100 and use a condition that checks whether the total registration count equals the target.
4. Review the notification logic to identify unnecessary repeated target-reached notifications.
5. Examine the Payment_Pending workflow and use the Reminder_Email_Sent Date-Time field to track reminder processing.
6. Apply a condition that checks the participant's Status, Email_Address, and reminder-tracking field before attempting to send a reminder.
7. Open Event_Registration_Report and identify unnecessary displayed columns.
8. Hide columns that are not required for routine participant review while retaining the underlying fields and registration records.
9. Review the Registration Status Board, Participation Dashboard, and AI Registration Analytics Dashboard for potentially redundant charts, KPIs, and summary components.

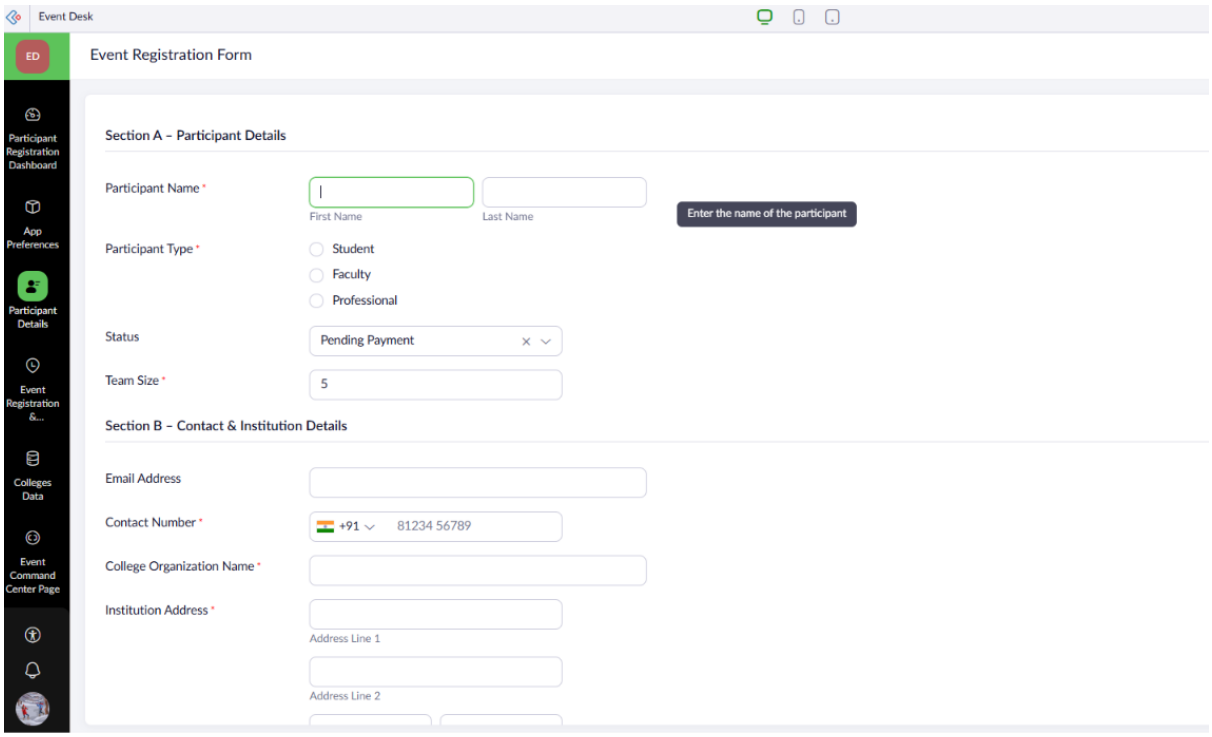

10. Examine the existing API connection and functions to identify possible inefficiencies while preserving their existing behavior.
11. Measure report and dashboard loading times using browser Developer Tools or a stopwatch. Repeat each measurement three times and calculate the average.
12. Record the observed workflow behavior, report responsiveness, dashboard loading times, and potential optimization opportunities.

Screenshots

1. Event Desk Home Page

Description: Displays the main interface of the Event Management Platform, including registration management, reports, workflows, and dashboards.

Screenshot:

2. Registration Target Monitoring

Description: Shows the Target_Monitoring workflow configured to monitor the target of 100 registrations and check when the target is reached.

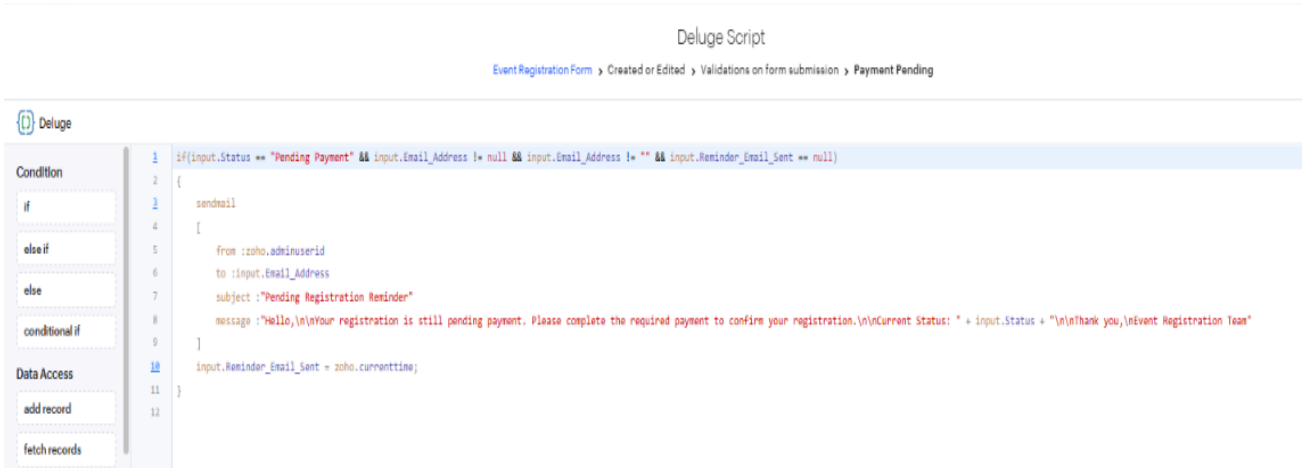

Screenshot:

3. Pending Payment Reminder Management

Description: Displays the Payment_Pending workflow and the Reminder_Email_Sent field used to track reminder processing and help prevent repeated reminder attempts.

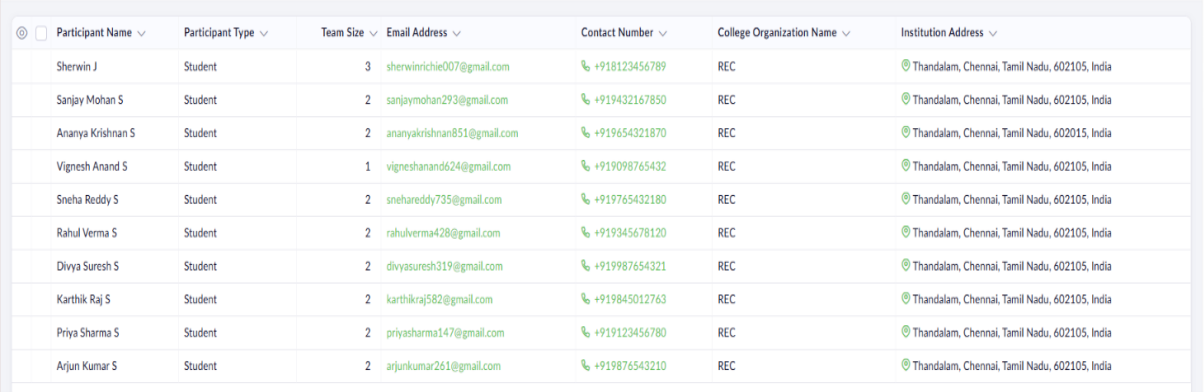

Screenshot:

4. Participant Report Optimization

Description: Shows the Event_Registration_Report with unnecessary displayed columns hidden to improve readability and simplify participant information management.

Result

The performance optimization of the Event Desk event management platform focuses on registration target monitoring, pending-payment reminder management, participant report presentation, dashboard component review, and API integration maintenance. The optimization approach aims to reduce unnecessary notifications, improve report readability, identify redundant dashboard components, and preserve existing registration functionality.
