Experiment – 6 : Workflow Automation using Deluge

Aim

To automate event registration activities in the Event Desk platform using Zoho Creator workflows and Deluge scripting, including registration confirmation emails, pending-payment reminders, status synchronization, duplicate registration prevention, status update notifications, and registration target monitoring.

Theory

Deluge (Data Enriched Language for the Universal Grid Environment) is Zoho's scripting language used to automate business processes, perform data operations, apply validation rules, and integrate application functions. In the Event Desk event management platform, Deluge workflows automate repetitive registration tasks, reduce manual intervention, and improve the consistency of participant management.

The platform uses the Event_Registration_Form form and its Status and Email_Address fields to manage registration information and trigger automated actions.

The following six workflows are used in the platform:

1. Registration Confirmation

Sends an email to participants after successful registration, confirming that their registration has been received and displaying their current registration status.

2. Pending Payment Reminders

Identifies participants whose status is Pending Payment and sends reminders requesting them to complete the payment process. A reminder-tracking field can help prevent repeated notifications.

3. Status Synchronization

Maintains consistency in registration status information and supports validation of permitted status values, including Pending Payment, Confirmed, and Checked-In.

4. Duplicate Prevention

Checks whether an email address already exists in the registration form and prevents duplicate registrations when each email address is intended to be used for only one registration.

5. Update Notifications

Sends an email to participants when their registration status changes, keeping them informed about the latest registration information.

6. Target Monitoring

Monitors the total number of registrations against a configured target of 100 participants and sends a notification to the organizer when the target condition is met.

Together, these workflows support automated communication, data validation, registration monitoring, and efficient event administration.

Procedure

1. Open the Event Desk application in Zoho Creator.
2. Select the Event_Registration_Form and identify the Status and Email_Address fields.
3. Create or configure the Registration Confirmation workflow to send an email after successful form submission.
4. Configure the Pending Payment Reminders workflow to identify registrations with the status Pending Payment and send reminder emails.
5. Configure the Status Synchronization workflow to validate or maintain permitted registration statuses.
6. Create the Duplicate Prevention workflow to check for existing email addresses before accepting a registration.
7. Configure the Update Notifications workflow to send emails when the participant's registration status changes.
8. Configure the Target Monitoring workflow to calculate the total registration count and compare it with the target of 100 participants.
9. Add the required Deluge scripts to the corresponding workflow actions, ensuring that the field link names and trigger conditions match the application configuration.
10. Save the workflow configurations and review their conditions to prevent unnecessary execution and repeated email notifications.
11. Check the registration form, status values, email fields, and target conditions for consistency.
12. Evaluate the workflow behavior using suitable test records and verify the resulting notifications, validation messages, and registration updates.

- else if
- else
- conditional if

Data Access
- add record
- fetch records

```
target_count = 100;
total_registrations = Event_Registration_Form[ID != null].count();
if(total_registrations == target_count)
{
    sendmail
    [
        from :zoho.adminuserid
        to :"sherwinrichie@gmail.com"
        subject :"Registration Target Reached"
        message :"Hello,\n\nThe registration target has been reached.\n\nTotal Registrations: " + total_registrations + "\nTarget: " + target_count + "\n\nPlease review the registration dashboard.\n\nEvent Registration Team"
    ]
}
```

Result

Workflow automation using Deluge in the Event Desk event management platform provides a structured approach to handling participant registration, payment reminders, status validation, duplicate prevention, update notifications, and registration target monitoring. These workflows reduce repetitive administrative tasks, support consistent registration data, and improve communication between event organizers and participants. The effectiveness of each workflow depends on the configured triggers, conditions, field link names, and successful execution of its Deluge actions.
