Experiment – 11 : Application Deployment and Migration

Aim

To understand and perform application deployment and migration for the Event Desk platform using Zoho Creator, ensuring that application components, forms, reports, dashboards, workflows, and related configurations can be transferred to or made available in the required environment.

Theory

Application deployment is the process of making an application available for use in a target environment. Application migration involves transferring an application, its components, and relevant configurations from one environment or account to another while maintaining its functionality and data integrity.

Zoho Creator provides features for managing applications, sharing access, exporting application components, and transferring applications between supported environments. In the Event Desk event management platform, deployment and migration help make the application available to intended users and support future maintenance or environment changes.

The platform contains forms, reports, dashboards, workflows, custom functions, and API connections that should be considered when preparing an application for deployment or migration.

The following concepts are relevant to the platform:

1. Application Deployment

Deployment involves making the Event Desk application available to its intended users. It includes reviewing application settings, confirming access permissions, and ensuring that the required components are available in the target environment.

2. Application Export and Import

Export and import features, where supported by the selected Zoho Creator environment, help transfer application definitions or components. The available transfer options and supported component types depend on the deployment method and Zoho Creator configuration.

3. Form and Report Migration

The Event_Registration_Form stores participant registration details, while the Event_Registration_Report displays the stored records. During migration, these components should be checked to ensure that their fields, configurations, and relationships are preserved.

4. Dashboard and Page Migration

The Event Desk platform includes the Registration Status Board, Participation Dashboard, and AI Registration Analytics Dashboard. Their configurations and data sources should be reviewed after deployment or migration to ensure that the displayed information corresponds to the intended registration data.

5. Workflow and Deluge Script Migration

The application uses workflows for registration confirmation, pending-payment reminders, status synchronization, duplicate prevention, update notifications, and target monitoring. Their triggers, conditions, Deluge scripts, and field references should be reviewed in the target environment.

6. API Connections and Authentication

The platform includes the event_registration_api_connection connection and the functions test_participant_api and test_create_participant. During migration, connection references, OAuth configuration, authorization scopes, and required permissions must be reviewed. Credentials and secrets should be handled securely and reauthorized where necessary.

7. User Access and Permissions

Application access must be configured according to the requirements of organizers, administrators, and other intended users. Permissions should be reviewed after deployment to ensure that users can access the appropriate forms, reports, dashboards, and functions.

8. Data Integrity

Data integrity means maintaining the accuracy and consistency of participant information during a transfer. Registration records, email addresses, status values, and related information should be checked to ensure that records are not unintentionally lost, duplicated, or altered.

9. Application Testing After Deployment

After deployment or migration, the application should be reviewed to confirm that its forms, reports, dashboards, workflows, and integrations behave as expected. Testing helps identify configuration differences, missing dependencies, and permission-related issues.

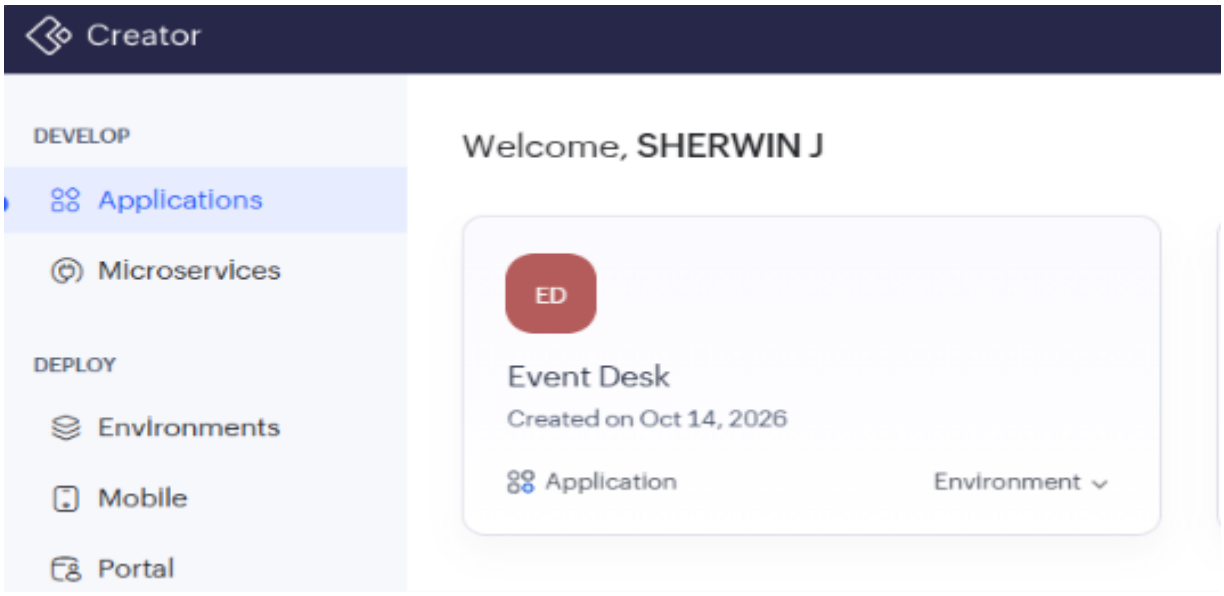

Together, these practices support the reliable deployment and migration of the Event Desk application while helping preserve its functionality, configuration, and registration data.

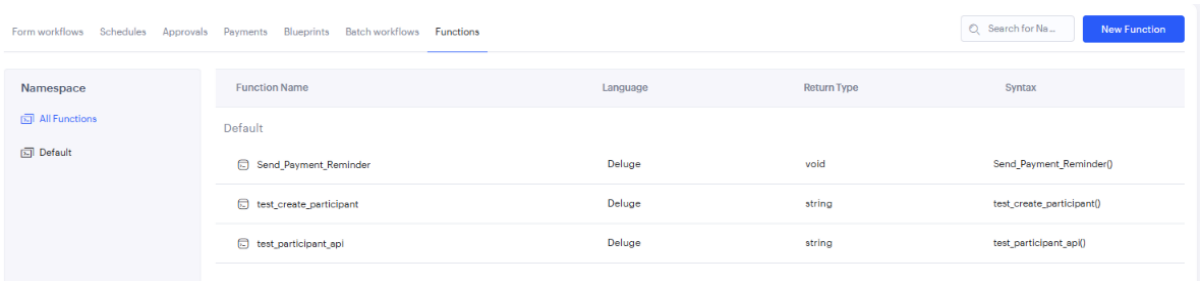

Procedure

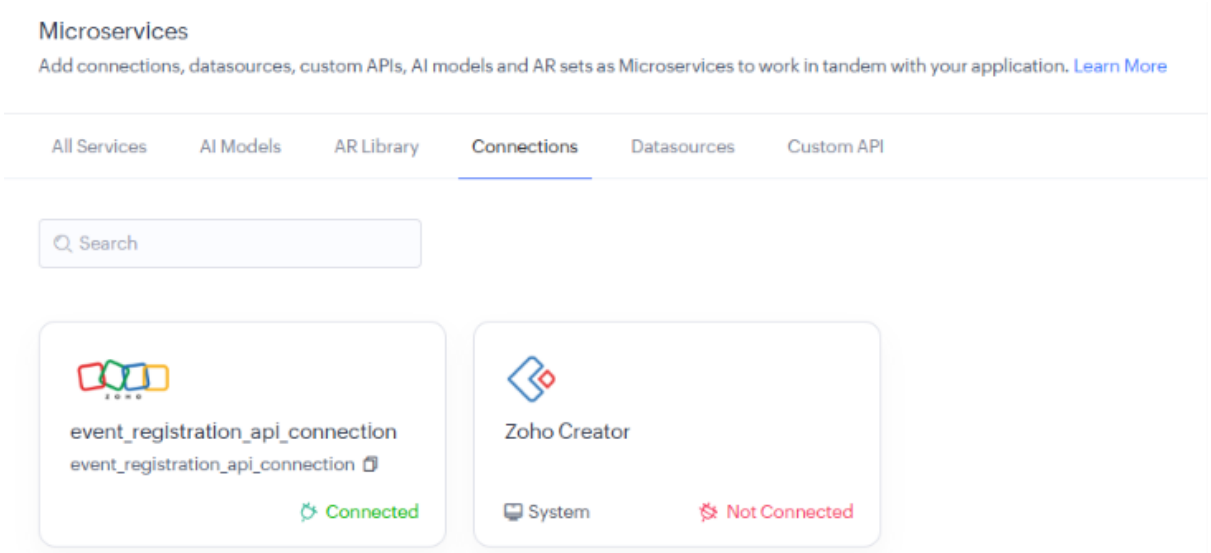

1. Open the Event Desk application in Zoho Creator and review its existing structure.
2. Identify the main components, including Event_Registration_Form, Event_Registration_Report, the dashboards, workflows, custom functions, and API connection.
3. Review the application settings and determine the appropriate deployment or migration method supported by the current Zoho Creator environment.
4. Check the available export, import, application-copying, or deployment options applicable to the application.
5. Prepare the application for transfer by reviewing its forms, fields, reports, pages, and dashboard configurations.
6. Review the six workflows and verify that their triggers, conditions, Deluge scripts, and field references are correctly configured.
7. Review the event_registration_api_connection connection and identify any authentication or authorization settings that may require reconfiguration in the target environment.
8. Protect API credentials, OAuth client secrets, and other sensitive configuration details during the transfer.
9. Use the appropriate Zoho Creator deployment or migration option to transfer the application definition or make the application available in the intended environment.
10. If migration to another environment is required, verify that the necessary connections, permissions, and application dependencies are available in that environment.
11. Review the participant registration form and report to ensure that their field structures and configurations are preserved.
12. Check the Registration Status Board, Participation Dashboard, and AI Registration Analytics Dashboard to confirm that their data sources and displayed information are correct.

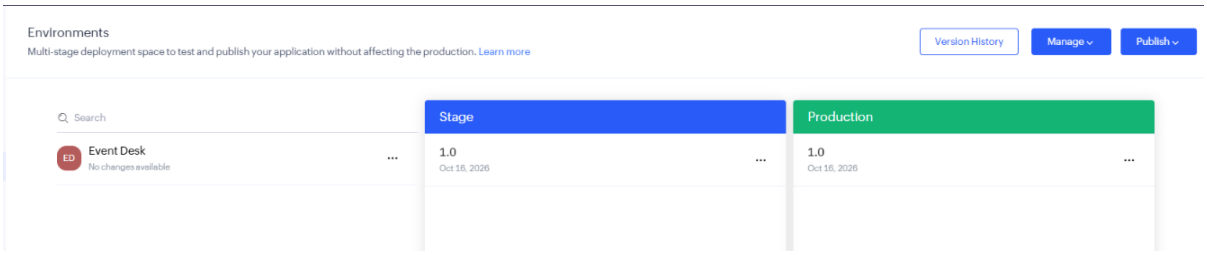

13. Verify the availability of user roles, access permissions, workflows, and custom functions in the target environment.
14. Test the application using suitable test records and verify form submission, report display, dashboard information, and workflow behavior.
15. Review any errors or missing configurations, make the necessary corrections, and confirm that the application is ready for use.

Result

Application deployment and migration concepts were studied in the context of the Event Desk event management platform. The procedure covers the preparation and transfer of application components, review of forms and reports, verification of dashboards and workflows, and validation of API connections and user permissions. These steps help maintain application consistency and data integrity when moving between supported environments. Successful deployment or migration must be confirmed by verifying the application in the target environment, as the exact transfer process depends on the available Zoho Creator features and configuration.
